

Displays: form and signal direction

22 October 2026 / Revision 2 / AI-assisted source reference; no independent review or hardware validation

Write source output, converter input/output and display input in that order. Similar ends do not make a converter reversible.

HDMI Type C / Type D	Mini HDMI and Micro HDMI are distinct forms. Compare an identified role and viewing side; on-screen size is not a measurement. [S038]
Mini DisplayPort / Thunderbolt	A shared outline does not establish the signal. The cited Apple Thunderbolt adapter excludes Mini DisplayPort displays. [S016, S521]
Passive DP to HDMI	The cited passive DP2HDMI2 class needs a DP++ source. Check the named product and complete mode. [S846]
Active DP to HDMI	Active conversion is a distinct product class. Direction, source acceptance and output limits remain product-specific. [S035]
HDMI to USB-C	Investigate a product explicitly documenting this direction and the display input transport. Do not reverse an ordinary opposite-direction adapter. [S003, S012, S035]
Cable category / whole system	A named HDMI cable class or certification does not establish every optional feature of the source/display. [S056, S052, S057, S012]

CHECK THE COMPLETE TASK

1. Name the exact source port, converter and selected display input; trace source -> converter -> display without reversing the arrows.
2. Write resolution, refresh rate and any required color/HDR feature as a complete mode. Check each stage, power and platform requirements.
3. If passive conversion is proposed, obtain explicit source DP++ evidence. Active wording alone is not a universal higher-mode guarantee.

STOP CONDITION

An unmodeled or undocumented path remains unresolved. It is not proof that every product for that direction is impossible.

Conceptual comparisons only: no wiring, fit, equipment compatibility or hardware-test approval.

Displays: form and signal direction
